2.3 feedback control theory feedback control theory deals with the reaction and con-trol of dynamic systems from feedback and outside noise [2]. the usual objective of feedback control theory is to control a dynamic system so that the system output follows a desired control signal, called the reference, which may be a xed or changing value. **state feedback and observer feedback** - feedback control  $u = kx + v$  where  $v$  is an exogenous input. in our example,  $v = 1$  is the reference input, and the feedback law is implemented as:  $u = kx + gv$  where  $g$  is a gain to be selected for reference tracking. here it is selected as 11:98 to compensate for the dc gain. as seen from fig. 4.2, the output yreaches the target value of 1. **the coordination of movement: optimal feedback control and ...** -
