Basic Genetics

The cell cycle, or cell-division cycle, is the series of events that take place in a cell leading to duplication of its DNA (DNA replication) and division of cytoplasm and organelles to produce two daughter cells. In bacteria, which lack a cell nucleus, the cell cycle is divided into the B, C, and D periods. The B period extends from the end of cell division to the beginning of DNA replication.

The term cell growth is used in the contexts of biological cell development and cell division (reproduction). When used in the context of cell development, the term refers to increase in cytoplasmic and organelle volume (), as well as increase in genetic material following the replication during S phase.growth|. This is not to be confused with growth in the context of cell division, referred to ...

Note: Although it is possible to distinguish a number of different histological sub-classes of lung cancer by light microscopy, the most important current clinical distinction is between small cell lung cancer (SCLC) and non-small cell lung cancer (NSCLC). Based primarily on its clinical behaviour, SCLC, a neuroendocrine lesion, is considered as a separate entity to the non-small cell carcinomas.

In genetics, a mosaic (or mosaicism) means the presence of two different genotypes in an individual which developed from a single fertilized egg. As a result, the individual has two or more genetically different cell lines derived from a single zygote.. Mosaicism may result from: Unusual events in cell division (). A gene mutation during development; A chromosomal mutation during development

In this activity, students apply concepts pertaining to the genetics of sickle cell disease and its relationship to malaria explored in the short film *The Making of the Fittest: Natural Selection in Humans*. Students work through questions and problems in three sections: mendelian genetics and probability, pedigrees, and chi-square statistics.
