

mohs surgery and histopathology pdf

Mohs surgery, developed in 1938 by a general surgeon, Frederic E. Mohs, is microscopically controlled surgery used to treat common types of skin cancer. During the surgery, after each removal of tissue and while the patient waits, the tissue is examined for cancer cells. That examination informs the decision for additional tissue removal.

Basal-cell carcinoma (BCC), also known as basal-cell cancer, is the most common type of skin cancer. It often appears as a painless raised area of skin, which may be shiny with small blood vessels running over it; or it may present as a raised area with ulceration. Basal-cell cancer grows slowly and can damage the tissue around it but is unlikely to spread to distant areas or to result in death.

Basal-cell carcinoma - Wikipedia

Although rare in developed countries, carcinoma of the penis is an important problem in the developing world. Circumcision done in childhood offers the greatest protection against this disease. Poor penile hygiene and phimosis are strong risk factors for development of penile carcinoma. Early disease can be treated by conventional resection of the penis, or in selected patients by organ ...
